

Accessing Databases with SQL Magic

To communicate with SQL Databases from within a JupyterLab notebook, I use the SQL "magic" provided by the ipython-sql extension. Below, I'll use the *load_ext* magic to load the ipython-sql extension. The following required modules are pre-installed in the Skills Network Labs environment. However if you run this notebook commands in a different Jupyter environment (e.g. Watson Studio or Anaconda) you may need to install these libraries by removing the # sign before !pip in the code cell below.

These libraries are pre-installed in SN Labs. If running in another environment please uncomment lines below to install them:

```
# !pip install --force-reinstall ibm_db==3.1.0 ibm_db_sa==0.3.3
```

```
# Ensure we don't load_ext with sqlalchemy>=1.4 (incompatible)
```

```
# !pip uninstall sqlalchemy==1.4 -y && pip install sqlalchemy==1.3.24
```

```
# !pip install ipython-sql
```

```
%load_ext sql
```

Now we have access to SQL magic.

Next, I connect to a Db2 database by retrieving my credentials to access my Db2 database.¶

```
%sql
```

```
ibm_db_sa://bcy01016:pPV11zoSkjmBw2pU@19af6446-6171-4641-8aba-9dcff8e1b6ff.c1ogj3s  
d0tgtu0lqde00.databases.appdomain.cloud:30699/bludb?security=SSL
```

Output:

```
'Connected: bcy01016@bludb'
```

Create a table and fill it with some test data

```
%%sql
```

```
CREATE TABLE INTERNATIONAL_STUDENT_TEST_SCORES (
```

```
    country VARCHAR(50),
```

```
    first_name VARCHAR(50),
```

```
    last_name VARCHAR(50),
```

```
    test_score INT
```

```
);
```

```
INSERT INTO INTERNATIONAL_STUDENT_TEST_SCORES (country, first_name, last_name,  
test_score)
```

```

I have a python variable `country` with a value of "Canada". I use this variable in a SQL query to find all the rows of students from Canada.

```
country = "Canada"
```

```
%sql select * from INTERNATIONAL_STUDENT_TEST_SCORES where country = :country
```

Output:

country	first_name	last_name	test_score
Canada	Cristionna	Wadmore	46
Canada	Wilhelm	Deeprise	54
Canada	Carma	Schule	49

I use an SQL query to retrieve the distribution of test scores (i.e. how many students got each score). I assign the result of this query to the python variable `test_score_distribution`.

```
test_score_distribution = %sql SELECT test_score as "Test Score", count(*) as "Frequency"  
from INTERNATIONAL_STUDENT_TEST_SCORES GROUP BY test_score;
```

```
test_score_distribution
```

Output:

Test Score	Frequency
38	2
40	1
43	2
44	2
45	8
46	7
47	4
48	14
49	8
50	10
51	8
52	8
53	8
54	5
55	4
56	1
57	2
58	4
60	1

```
# Convert the SQL query result to a pandas dataframe. Then, plot the test score distribution.  
dataframe = test_score_distribution.DataFrame()
```

```
%matplotlib inline
```

```
# uncomment the following line if you get an module error saying seaborn not found
```

```
# !pip install seaborn==0.9.0
```

```
import seaborn
```

```
plot = seaborn.barplot(x='Test Score',y='Frequency', data=dataframe)
```

```
# Output:
```

```
# Analysis: The plot shows that the most common test score was a score of 48 points, and most  
of the test scores lie in the range between 45 and 53 points.
```
